

Data Backup & Recovery

Recover any data, anywhere, anytime.

Modern data protection is an overwhelming sea of hardware & software. The status quo is patching one complex solution over another, leaving you to rely on only out-dated processes and updated buzz words. It's the business outcome that matters: should anything go wrong, will your data be protected and how long will it take to recover?

A hybrid backup & recovery solution is the automatic and secure way to ensure all your data and devices you rely on are protected and available to you anytime, anywhere – all at an affordable price.

Over 50 million backups each year are done using hybrid cloud backup & recovery, making it one of the most used, cost-efficient methods of preparing for the worst.

Data Backup & Recovery includes:

- Redundancy and availability that tape can't provide
- Better data durability - no lost data due to tape failures
- Comprehensive systems backup for bare metal recovery
- Encryption to protect data
- Access to backups when there is no internet connection
- Storage is infinitely scalable
- Hybrid functionality - recover from the fastest location
- Real-time alerts
